

A combination box scraper assembly compatible with a tractor's three- point hitch and includes a self-guiding hitch system which enables the connection of a variety of tractor implements to the box scraper. The box scraper includes a hydraulically operated tool attachment, and a rake member that is manually raised and lowered with a lever. A horizontal support member is fixedly disposed between the sides of the box scraper. First and second arms are attached to the support member and upwardly extend from the support member and converge to form a bracket member for attachment to the tractor's three- point hitch. The lower ends of the arms are spaced apart for attachment to the tractor's hitch system. First and second plates are attached to the support member parallel to the first and second arms. The first and second plates each have an extension member that downwardly depends from the plates. Each of the extension members include an extension aperture for connecting the box scraper to the tractor implement. Each of the extension members further include an angled stop block attached to the outer surface of the members. The tractor implement includes a brace member and a pair of brackets attached to the brace member and spaced to receive and connect the extension members of the box scraper to the implement with connecting pins.
